Google has released the Android 2.0 SDK as of October 27th, 2009. We know how eager everyone has been to get their hands on Android 2.0, so we have decided to write up instructions so that anyone may download and install the SDK, then create and run an emulator instance. We had put the same thing here([link to our post](#)) in which there was an emulator by which you could run the previous version of Android and now we are doing it again for Android 2.0.

So here is how the procedure goes we know its bit long but believe us it is going to work.

1) Download appropriate file for your system from <http://developer.android.com/sdk/index.html>

2) Extract to desired location

3) Run “SDK Setup.exe” (or the equivalent for your system)
